An AI agent that won't let you forget

A daily planner that doesn't stop at one reminder — it keeps checking back until the task is actually done. An idea for discussion — nothing has been built yet.

● How it could work

Just tell it what you need to do

Plain language in, a persistent agent out — no forms, no app to learn

✍️

Write it like you'd text a friend

"Submit documents by tomorrow 3pm" or just "Call the plumber" — the AI figures out the task and the deadline on its own

🔁

It keeps checking back

Not a single ping — the agent reminds you periodically, with buttons: ✅ Done · ⏳ Not yet · 🔁 Snooze, until it's actually closed

📅

One command, the whole day

Type /today to see every task for today — done and still open — in one list

• What makes it an agent, not just an alarm

It notices when you're avoiding something

A regular reminder app fires once and forgets. This one pays attention

📣

Escalates when ignored

Snooze the same task a few times in a row, and the tone changes: "This is reminder #5 — is everything OK?"

🗂️

Everything in one place

Later: a dashboard showing every task across every day — how many times each one had to nag you

🎯

Adapts to how you actually work

If a task type keeps getting pushed to evening, the agent can learn to schedule it there in the first place

What do you think?

Would you actually use something like this to stop putting things off?

Which part matters most to you — the plain-language input, the persistent reminders, or the escalating tone?

What's missing, in your opinion?
